

KPKILL(e)

KPKILL(e)

NAME

kpskill — terminate a kernel process

SYNOPSIS

kpskill pid

DESCRIPTION

Kpskill sends a *kill* event to the kernel process number *pid*. *Kill* cannot be used because it sends a message with a *kill* signal in the body to kill the target process. Most kernel driver processes do not accept these messages.

SEE ALSO

kill(1), tkill(e), pkill(e), ps(e).
